

Theory

Key Message

Networks are manifestation of inherently continuous systems with no to little clear binary relationship. Focusing on this fundamental, obvious nature reveals subtle nuances neglected and masked by discrete thinking.

From discrete thinking → continuous thinking

- Summary**
- Nature is continuous in nature
 - We understand it by contrasting and bridging to reconstructed
 - Successful in machine learning
 - Can we use the and/or best Rep.?

- slow case effectiveness**
- human mobility **Regression**
 - capture nuances
 - multifaceted aspects
 - Disruption Index **Metric**
 - Extends and Publish
 - Simultaneous Discovery
 - Because the index is continuous
 - Community Citation **Modeling**
 - Prioritize the perspective
 - Success is actual
 - Modeling success

why should we care?

more nuances

improve spatial modeling

not just about it is higher resolution but subdimensional

slow case in science

- Takeaways**
- Human mobility
 - slow that embedding uncovers multi-dimensional aspects
 - no dichotomy - continuous!
 - Grounded in human mobility → Embedding is grounded on physical world!
 - Intellectual mobility
 - Topic Map?
 - Hyperbolic space
 - Knowledge!
 - How human accumulate knowledge? and make innovations
